

## Molecular Biology and Cellular Imaging Facility Core

The purpose of the MBCIF core is multi-fold. Our goals are to: 1) Promote training of researchers in emerging molecular biology and cellular imaging techniques to support state-of-the-art, laboratory-based environmental health research. 2) Accelerate developmental research while minimizing costs. 3) Adapt emerging technologies in molecular biology and cellular imaging for environmental health studies, with a particular focus on developmental and comparative biology. 4) Maximize communication between MBCIF Core members and foster new collaborations.

By pursuing these goals we will support our mission to foster and accelerate interdisciplinary work among basic and clinical investigators in environmental health and to draw more investigators into the environmental health field.
